

TWO / THREE STAGE FILTERS:

This type of filter has 2-3 canisters, The canister set up can be purchased at many hardware stores for under 100.00 generally.

Stores which specialize in swimming pool accessories generally have the full water analogy of the outlying areas. I recommend discussions with these stores for choice of filters.

Recommended are:

1. Filter to extract chlorine
2. General contaminates
3. Sulphur [if high levels are detected]

Request the natural minerals are left intact

Natural minerals in ALL water from the earth is imperative to maintain within the water we consume. The natural minerals allow frequency to be transferred amongst the tissues within the body. This important function allows organs to be signaled and multiple other functions within the cells.

With the majority of population in North America consuming bought REVERSE OSMOSIS water today consumers are unaware this type of fluid has no natural minerals. When people discover their need for earth minerals in their water their health generally improves rapidly.

Removing the chlorine from your water in addition improves health. Keep in mind this type of system will clean the water although will not reduce the size of the multi-cluster. Hydration will remain at approximately 7-15 % of what you consume.

Consumer who would like to purchase larger units which in the USA cost approximately \$300.00 / in Canada can cost as high as \$700.00. The larger units work as the smaller units. The difference is the larger units can be installed with an on / off tap where the cold water is piped into the home. This will remove chlorine and contaminates out of the entire water system.
